

ELIMINATOR

Eliminator a Unique Rat Control Formula:

Eliminator is a unique rat control formula, designed and developed based on intense studies focused on rat behavior. Eliminator is first of its kind, ready to use rat control product supplied in powder to semi granular form. Eliminator is specifically designed for Poultry, Food, Agriculture, Dairy and other sectors where they incur huge economical loss due to poor and inefficient rat control measures.

Eliminator Protects Farmer From Huge Feed Losses:

Eliminator protects the farmer from huge losses due to feed damage by rats.

- ♦ **Broiler Breeders:** Rs.28.80 per bird (64 kg@ 22.50 per kg approx.)
- ♦ **Commercial Layers:** Rs 15.96 per bird (42 kg@ 19.00 per kg approx.)
- ♦ **Commercial Broilers:** Rs.2.14 per bird (3.4 kg@31.50 per kg approx.)

Amount spent on Eliminator package (4 times a year)

- ♦ **Broiler Breeders** : Rs.2.40 per bird.
- ♦ **Commercial Layers** : Rs 1.20 per bird
- ♦ **Commercial Broilers** : Rs.0.15 per bird.

Why Eliminator Is Unique

- ♦ Minimum quantity of bait that is as low as 2 grams bait is sufficient to kill the rat effectively.
- ♦ Around 60-80 % of the rats in the farm can be killed in a single shot provided the bait station with Eliminator Powder is installed properly.
- ♦ No Bait shyness.
- ♦ More than 80% of the rats exposed to Eliminator Powder die in burrows and hence there are hardly any issues pertaining to bio-security and hygiene.
- ♦ Eliminator Powder is stable for months together under proper storage conditions (when not exposed to dirt/moisture).

Important Note:

For achieving better results, installation of Bait Stations with Eliminator Powder should be completed in a single day, irrespective of the farm size.

Dosage:

25 Kg container along with 150 Bait Stations is sufficient for controlling rat population in a farm of

- 10000 Broiler Breeders, 20000 Commercial Layers, 40000 Commercial Broilers.

25 Kg MS Container

ELIMINATOR

ELIMINATOR POWDER

Rats-A Serious Menace Globally:

- ♦ Rats are omnivorous.
- ♦ Rats are more active during night time. (NOCTURNAL).
- ♦ It is estimated that rats damage >15 to 20% of total grain production.
- ♦ **They consume and destroy more than 2% of national poultry feed.**
- ♦ Rats consumes feed that is ~ 10% of its body weight and damages 3 times more quantity of feed (by spillage, urination & dropping making it unfit for consumption).
- ♦ Acts as vectors and reservoirs for many dreadful diseases (Fowl typhoid, Fowl cholera, Salmonellosis and many other coliform infections).
- ♦ They weaken the foundation of poultry sheds, hatchery buildings, cold storages, generator rooms and other storage facilities.
- ♦ Damages/consumes eggs & kill / eat chicks during brooding period.
- ♦ Rats injure and disturb the older birds (growers and layers) & results in bird stress, drop in production and mortality.
- ♦ Apart from food/feed materials, rats also damage electrical cables, wires, water pipe lines, cooling pads, record books, curtains, egg trays, clothes, grocery and other automatic equipments in poultry sheds.
- ♦ Rats act as hosts for lice and mites, during depopulation of the farm and when new batch arrives these ectoparasites migrate to chicken body.

Why Rats Are So Active And Damage Everything They Bite?

- ♦ Rats have 2 Jaws (Upper and Lower) and each jaw have a pair of incisor teeth which grows constantly (>7cms per year) throughout its life.
- ♦ To arrest the growth of incisor teeth rats keep on grinding their teeth (BRUXING/NIBBLING) and bites the hard objects. If the growth of incisor teeth is not arrested, rats cannot chew the food with its mouth and dies of starvation.

HOW INTELLIGENT RATS ARE?

- ♦ Rats remembers negative experiences and communicates the same to all other rats.
- ♦ Rats do express their love and affection by licking each other.
- ♦ Rats can remember and memorizes the taste right from their first conception in mother's womb.
- ♦ Rats stringently follow PERSONAL HYGIENE and basically cleans their own body surface by licking. Their body is so flexible that they can lick almost every part of the body.

IDENTIFICATION OF TYPE OF RAT INFESTATION:

By droppings:

Norway Rat

Rounded ends

Roof Rat

Pointed ends

House Mouse

Pointed ends

Rat Species That Majorly Effect Poultry Industry

Rattus Norvegicus
(Norway Rat)

Rattus Rattus
(Roof rat)

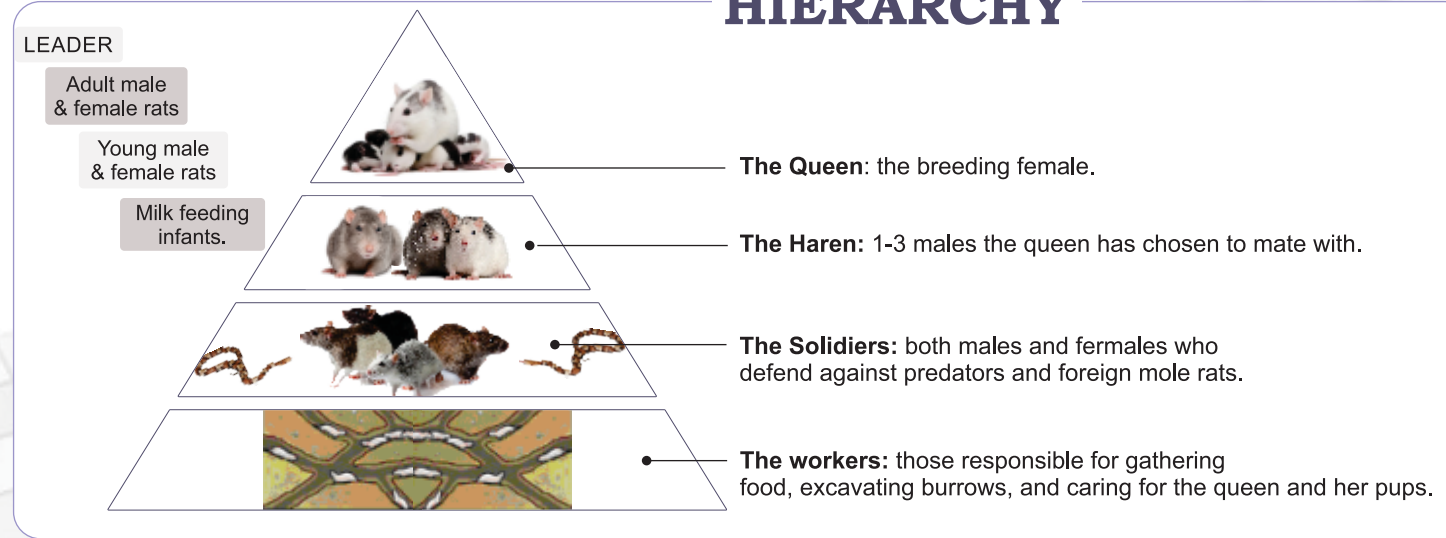

Bandicota Bengalensis
(Bandicoot rat)

Mus Musculus
(Mouse)

BREEDING HABITS:

The age of maturity for rats is 90 days and their life span is around 3 years. The gestation period of rat is 21 days and average number of rats per litter is 12-15 per gestation which may even go up to 24 in some cases. The young develop rapidly and at the age of three months old commence to breed. The number of breeding cycles is 8 to 10 per year. In the first year 1 pair will give raise to nearly 1200 offspring's while in the 2nd year it reaches 1.5 Million. Females are ready for breeding from the very next day of delivery. Males show very high mating efficiency and needs 2 seconds for mating. Healthy male Rat can mate up to 100 times in a day.

Life Cycle

Rodents reproduce rapidly, meaning a rodent problem can easily go from bad to worse before you know it.

If 4 - 7 Litters
per year
X
12 - 15 pups
per gestation

=

32 - 84 pups per year

Unlike most pests, rodents don't hibernate during the winter They'll actively seek warmth and quickly begin reproducing, so be vigilant.

HOW TO ESTIMATE THE RAT INFESTATION:

Time when rats are found	Probable number of Rats
visible occasionally at night times	100-500
Visible occasionally at day time and numerously seen during night times	500-1000
visible all the time during day time	>5000

CONTROL MEASURES: Universally 4D approach is being followed for the control of rats

- ♦ Deny Entry
- ♦ Deny food
- ♦ Deny Shelter
- ♦ Destroy
