

THERMIQUIT[®]

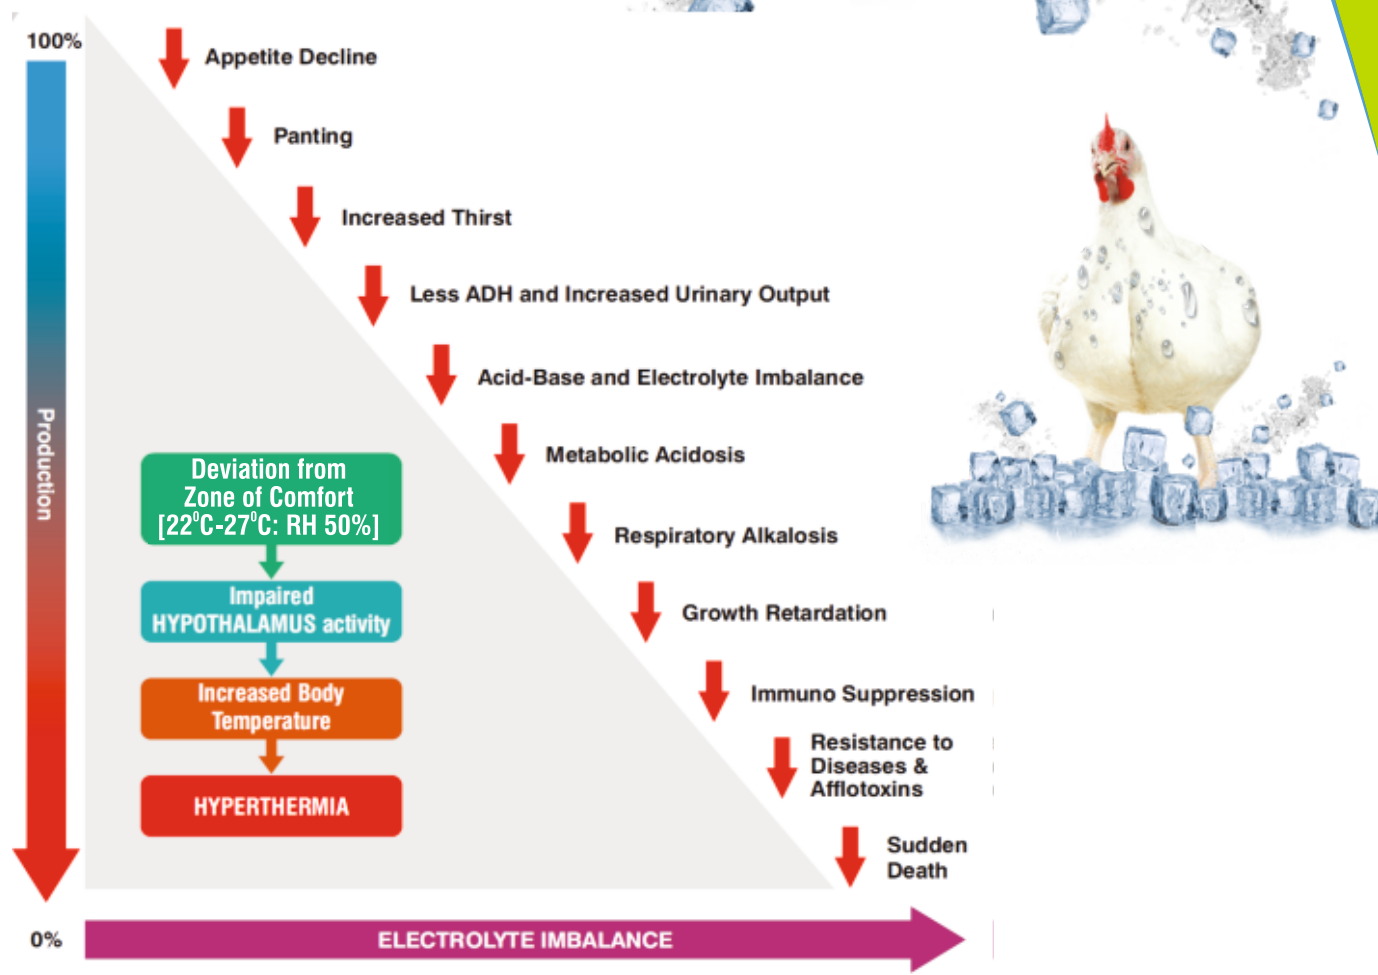

What is Hyperthermia / Heat Stress?

- ✦ **HEAT STRESS (or) HYPERTHERMIA** is the major cause for loss of production and loss of profit in tropical and subtropical regions of the world.
- ✦ Bird is said to be in **ZONE OF COMFORT** and feels comfortable when the ambient temperature is between 22°C to 27°C and Relative Humidity is 50%. But when the ambient temperature and relative humidity increasingly deviates from the above specified limits, then the bird enters into **ZONE OF DISCOMFORT** or **Heat stress** or **HYPERTHERMIC** state.
- ✦ Heat is acquired from body metabolism and external sources. In normal course heat is usually lost by radiation, convection and conduction. But for all the processes to take place, outside temperature must be less than bird's body temperature.
- ✦ Hyperthermia is therefore a physiological status of bird, in which birds fail to achieve balance between "body's heat production" and "body's heat loss".
- ✦ In hyperthermia, the methods meant for loss of heat from the birds body are insufficient and in order to compensate this insufficiency, birds start Panting. During this phase, depending upon severity, bird's respiratory rate may go up to 10 - 20 times higher than normal along with higher heart beats.
- ✦ During this stressful conditions, balance between intracellular / extracellular fluids and water is lost and results in loss of dietary electrolyte balance (DEB).
- ✦ Raise in body temperatures also results in Low ADH levels and increased micturition, where urination frequency increases and more loss of water and electrolytes occur. Such severe electrolyte imbalance and water loss affects both survival and productivity in birds.
- ✦ Added to the above, poor ventilation, poor animal husbandry and poor management practices will slowly and steadily increase body temperature of birds to an extent where production stops and results in the onset of SURVIVAL CHEMISTRY involving several stages as depicted below, eventually leading to mortality in birds.

Survival Chemistry in Hyperthermia

RR Veterinary Health Care Private Limited launches a scientifically balanced electrolyte supplement "THERMIQUIT" that helps the bird to fight with hyperthermia in birds.

Key Benefits:

- ◆ Thermiquit Balances electrolytes across the cells.
- ◆ Thermiquit Significantly increases thirst in birds and eventually increases water intake.
- ◆ Synthetic and herbal anti-pyretic agents in Thermiquit helps to regulate birds' body temperature
- ◆ Thermiquit creates suitable environment for water to perform its electrolytic activity.
- ★ Thermiquit, relieves heat stress and restores the bird to zone of thermal comfort.

Dosage: THERMIQUIT POWDER:

- ◆ General Heat Stress: 250-500 gm/Ton of Feed
- ★ Acute Heat Stress: 500 gm/Ton of feed

THERMIQUIT LIQUID:

- ◆ General Heat Stress: 0.5 -1 ml/ Ltr of water
- ★ Acute Heat Stress: 1.5 -2 ml/ Ltr of water

(OR) As suggested by the Veterinarian.

Presentation:

Liquid: 5 Ltr HDPE container.

Powder: 10 Kg Laminated BOPP bag.

RR VETERINARY
HEALTH CARE PVT. LTD.

An ISO 9001:2015 Certified Company

#4-122/1/1, Plot no. 115 & 123, Kuntloor Village, Abdullapurmet Mandal, R R Dist - 501 505, Telangana, INDIA.
