

ZITHROSURE™

Azithromycin Oral Powder/Suspension

Composition:

Each 1 ml oral suspension contains:

Azithromycin Dihydrate I.P

Equivalent to Azithromycin :40 mg.

Each gram of WS powder contains:

Azithromycin I.P100 mg.

Description

AZITHROMYCIN is an Azalide antibiotic, and has similar mechanism of action as macrolides (e.g., erythromycin), which inhibits bacteria protein synthesis via inhibition of ribosome. Azithromycin is a common antibiotic that blocks protein translocation. The bacterial ribosome is a 70S particle (30S subunit + 50S subunit). The 30S subunit binds mRNA and initiates protein synthesis while 50S subunit binds aminoacyl tRNA and catalyzes peptide bond formation. Azithromycin irreversibly binds to a site on the 50S subunit on the bacterial ribosome, thus inhibiting the translocation steps of protein synthesis.

Spectrum of activity: spectrum of activity of Azithromycin is primarily gram positive cocci, including streptococci and staphylococci. It is also active against Mycoplasma spp., Chlamydia, and some intracellular pathogens.

Pharmacokinetic data show extremely long plasma, tissue, and leukocyte half-lives. Azithromycin, like other long-acting macrolides, is characterized by low plasma drug concentrations, but much higher (100-200x) concentrations in leukocytes, bronchial secretions, and some tissues. Azithromycin, like other macrolides, exerts therapeutic benefits not solely explainable by antibacterial activity. Azithromycin has multiple immunomodulatory effects that are likely to contribute to the therapeutic response in respiratory infections, and perhaps other diseases. Even with infections caused by organisms not susceptible to azithromycin in vitro, such as infections caused by Pseudomonas aeruginosa, azithromycin has produced benefits by decreasing the virulence properties of the organism (e.g., inhibition of quorum sensing and inhibition of biofilm).

Other beneficial effects of Azithromycin include enhanced degranulation and apoptosis of neutrophils and inhibition of inflammatory cytokine production. It also may help clear infections by enhancing macrophage functions.

Indications:

ZITHROSURE™ is indicated for treatment of Chronic Respiratory Diseases (CRD) caused by Mycoplasma spp. And URTI caused by Gram positive Bacteria in poultry.

Description:

AZITHROMYCIN is an Azalide antibiotic, and has similar mechanism of action as macrolides (e.g., erythromycin), which inhibits bacteria protein synthesis via inhibition of ribosome. Azithromycin is a common antibiotic that blocks protein translocation. The bacterial ribosome is a 70S particle (30S subunit + 50S subunit). The 30S subunit binds mRNA and initiates protein synthesis while 50S subunit binds aminoacyl tRNA and catalyzes peptide bond formation. Azithromycin irreversibly binds to a site on the 50S subunit on the bacterial ribosome, thus inhibiting the translocation steps of protein synthesis.

Dosage and Directions for Use:

10 mg per kg body weight or 2.5 ml per 10 kg body weight
(or)

As directed by Veterinarian.

Withdrawal Period:

Milk: 7 days

Meat: 28 days

Presentation:

WS powder: 100 gm sachets & 500 gm sachets.

Oral Suspension: 500 ml, 1000 ml HDPE Containers.
